

Ontological Engineering Manual: Phase VI Certification Protocol and Crystal Governance

Master Architect: Gonzalo Emir Durante

March 7, 2026

Introduction: The Operating Standard

Phase VI establishes the legal and technical implementation framework for AGI. It defines external auditing mechanisms and civil liability levels derived from the use of the Durante Constant ($\kappa_D = 0.56$).

Ontological Stability Seal (OSS)

Any language model aspiring to a "Human Safety" certification must issue a **Stability Metadata** tag with every response.

- **Class A Certification:** Structural coherence ≥ 0.56 .
- **Class B Certification:** Coherence between 0.44 and 0.56 (Hallucination risk warning).
- **Null Class:** Coherence < 0.44 (Mandatory automatic block).

Fail-Safe Protocol (Disconnection)

The **Invariance Kill-Switch** is hereby established. If the monitor detects that semantic entropy exceeds the critical limit defined in Phase I, the system must immediately cease output. Failure to implement this protocol constitutes **Manifest Technical Negligence** on the part of the operating entity.

Governance and Calibration Ownership

Sovereignty over the **Master Tensor** and the recalibration of the Durante threshold resides exclusively with the Original Author and designated auditing bodies (NIST/TAD). Any alteration of the 0.56 constant without supervision invalidates the manifold's safety.

Legal Conclusion

This protocol serves as the AGI's "Liability Insurance." Having been publicly notified, corporations assume full responsibility for any damage derived from responses that do not meet the 0.56 standard.

"Responsibility is born from the ability to measure. 0.56 is the measure of commitment."
